

Professional WAP (Programmer to programmer)

The Wireless Application Protocol (WAP) provides a universal open standard for bringing Internet content and advanced services to mobile phones and other wireless devices. Designed from the start to take account of the limitations of today's devices - small screen, low power and low bandwidth - WAP is the platform for the new generation of media phones. Professional WAP gives a broad overview of WAP and associated technologies - what it is, why it's useful and how to take the best advantage of it. It covers the WAP architecture and protocols, what WAP tools and servers are available for developers today and how to WAP-enable your web server. Practical examples will show you how to make content and services available over WAP using WML Decks and WMLScript. More advanced topics include administration, transactions, security, and integration of telephony with internet services (WTA). The book is principally aimed at web developers who are experienced in HTML, scripting, probably some server-side technology, and who now want to find out how to apply their skills in the WAP world. It will also appeal to project managers, application architects or other professionals who want to gain an understanding of WAP technologies and how businesses could benefit from them.
